QUALITY LIFE REPORT

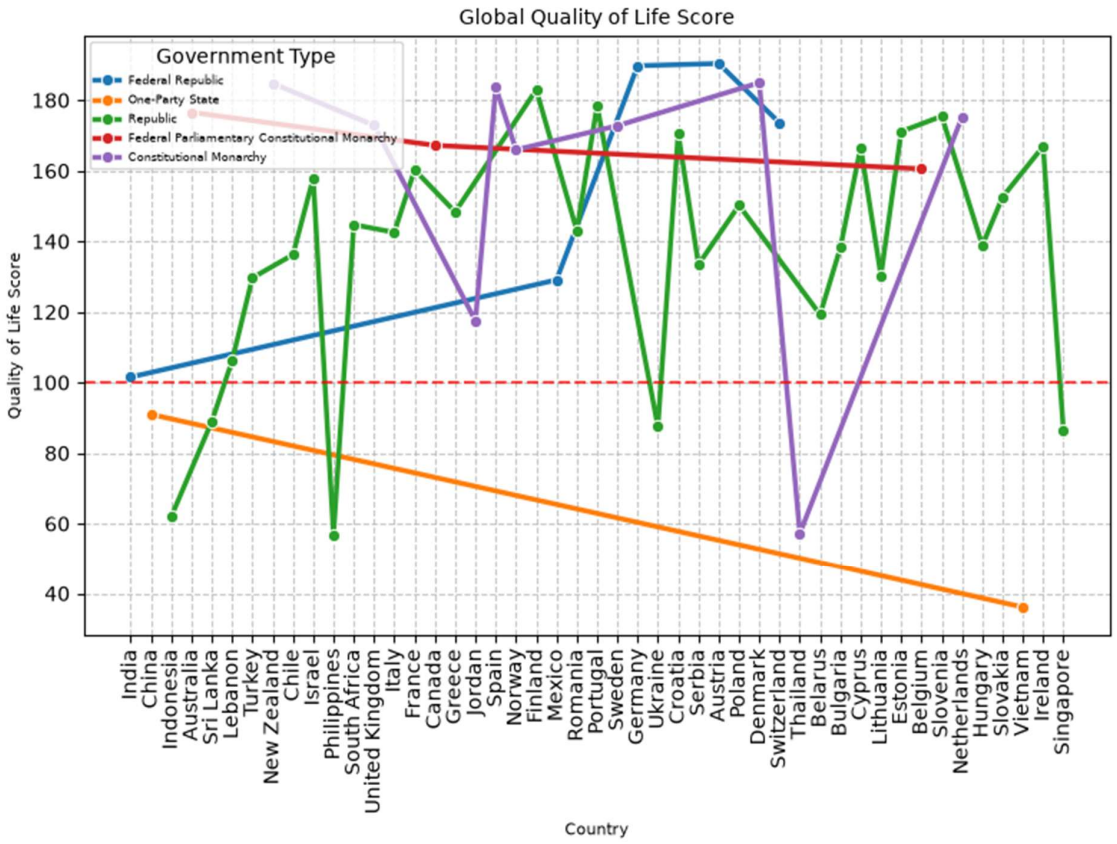

Over view

The above graphs depicts how economic factors effects the quality of life inside a country where the blue dots representing countries and the axes represent {factors} and quality of life. Each chart features a scatter plot, a linear regreesion trend line (red line) , the pearson coefficient(r) and the shaded pink region is confidence interval

Insights:

1. *Poor indicator*-We see flat trend line in export goods factor (r=-0.04)which shows that countrys total export value donot guarantee higher quality life for its citizens , commodity output donot always translate directly in domesdtic property and citizen weel being.
2. *Direct impact*-Whereas purchasing power vs quality life index (r=0.76) indicates that individual financial stability, affordability and personal economic freedom can drive societal happiness.
3. *Systematic investment*-Public infrastructure like education funding(r=0.53)plays a supportive role in raising overall living standards

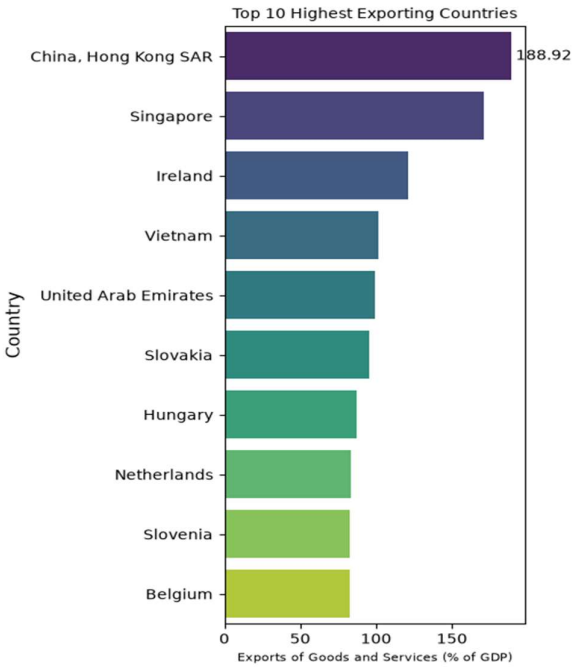

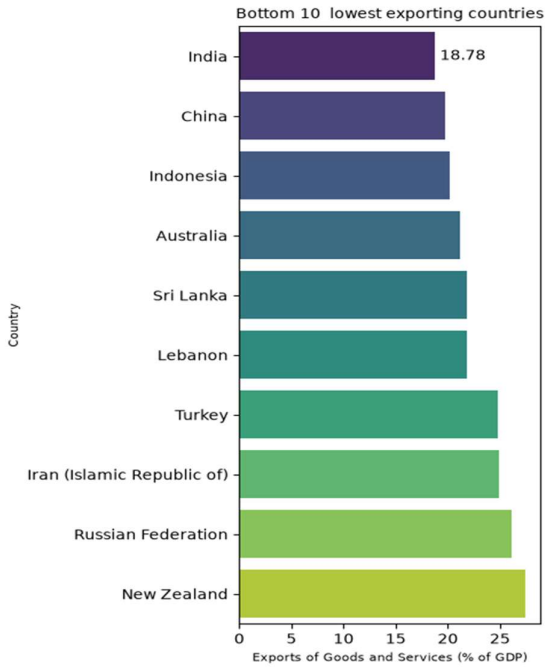

Overview:

This plot displays quality life index across different countries (quality life score >=100)along x-axis and categorized by their Government type indicated by different coloured lines as describeed in the legent on the top left corner.

Insights:

- ✓ *republics(greenline) amd federal republics(blue line):* vary wide range of quality of life spectrum, while developed European Nations score high but other with low scores , which shows these widely accepted form of Govt dosen't guarantee uniform standard of liviing.
- ✓ *One party states (orange line):* shows a consistent down ward trend across countries
- ✓ *Constitutional Monarchies(purple line) and Federal constitutional monarchies(red line)* : cluster towards the higher ends though they can experience sharp drops accordiing to country
- ✓ Overall Federal Republic and Federal constitutinal monarchies present more stable elevated baseline.
- ✓ We observe majority of countries adopted Repulics and Constitutional Democracies which focus on public representation and civil rights
- ✓ Monarchy System of Governance prioritizes centralised and stability enforced

Overview:

The above both charts tracking both the top 10 and bottom 10 exporting nations, Exports really play a vital role in shaping country's economy. However , having a low export percentage not always "lesser" than the high export ones.

Insights:

High Export-to-GDP ratio(Hong Kong,singapore, Ireland,etc):

- ✓ These countries import Raw mqaterials and after processing the raw material they Re-export them on massive scale.
- ✓ This brings foreign capital and high profit margins leads to rapid wealth generation. This also help in industrial developoment and job creation .

Vulnerabilities:

a)They rely heavily on global trends and easily affected by them, like global recession , international disputes.

b)they voften vulnerable to foreiign exchange fluctuations and global demands.

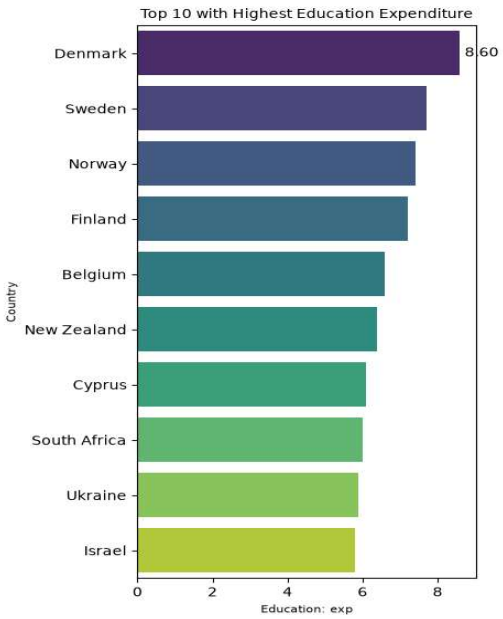

Low Export-to-GDP ratios(India,China,USA,etc):

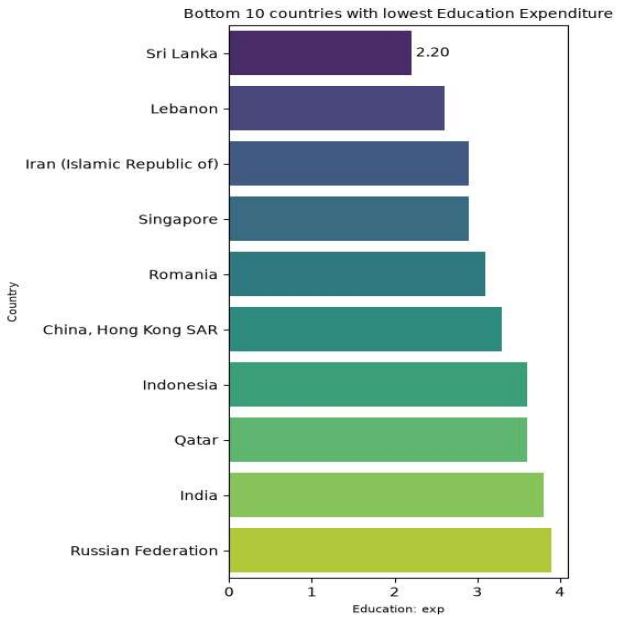

- ✓ These large populous nations have their massive internal markets,their export percentage makes overall very small portion of gigantic domestic economy.
- ✓ These ecomomies are insulated frm global shocks, their massive internal consumer base can keep the economy moving forward.
- ✓ These countries are good producers with diversified range of goods from agricultural -heavy industrial good reducing their reliance from external supply chains.

Vulnerabilities:

a) With strict and restrictive bureucratic domestic policies lkead to lower export ratios

b) Local businessnes trying to scale abroad face dificulties

Overview:

Nordic and European states typically allocate a much larger funds twards education infrastructure , whereas other major economies loke china , India shows lower official govt expenditure ratios itn this dataset.

Insights:

- ✓ Denmark ranks the hieghest with an expenditure of 8.60% of its gdp and similarly the other countries
- ✓ This also corelates with these countries high Quality of life index , which proves the importance of Education infrastructure

Summary:

- ❖ We correlated different economic parameters with quality of life acros different countries and established the relation between them.
- ❖ We also researched about countries govt type and its relation with quality of life of the country ,we saw how federal and republic govt shows relatively higher quality life but it doesn't ensure for every country as we noticed the down trends
- ❖ We also figured out some of the major exporting countries and bottom exporting countries and understood their pros and cons.
- ❖ We then extracted which countries are more education focused and how it leads to their high quality of life index

Conclusion: The high export dosen't automatically guarantee quality of life what matter is that how much liberty public has on expenditure and their domestic condition , also the govt type also not a major factor In deciding the quality of life

Future Work: compare *Defense strength of countries* and how much *safety a country provides.*
